Wet extractors: crafting manual v1.1

Materials (see figures):
- Plastic funnels, ø 10-15 cm
- Rubber/silicone hoses tightly pushed up on the lower narrow part of the funnel
- Removable plugs for the bottom part of the hoses (i.e. clamp, squeeze clip). Optional, can be replaced by tweezers/own fingers.
- Plastic/stainless steel kitchen sieves that fit snugly in the funnel (mesh 1-2 mm)
- Funnel holder – a device to keep the funnels upright, e.g., a board with holes
- Heat source on top of each funnel or a group of adjacent funnels (e.g. heating halogen or incandescent lamps ~60 Watts*).

Instructions: no manual is available, the pictures and elements are given below.

*The bulb may be surrounded by a hood to make the heat impact more efficient. For enchytraeid extraction it is important that the heat goes down to the bottom of the sieve, it should reach 40°C in the sample.*
